BALTIMORE, MARYLAND

A new identity and mission for an academic neighborhood

A 1991 sign program designed by Cloud and Gehshan Associates gave Baltimore's University Center neighborhood an identity and vitality it had never known. Centered around anonymous university medical buildings and suffering from comparison with a nearby festival marketplace and Camden Yards ball park, the neighborhood needed signs that would communicate that a lot was going on behind

the scenes. At the same time, the program had to emphasize a new state plan to build excellence in life sciences.

Bright colors and unexpected shapes breathe life into simple directional signs and markers. Banners and a new motto, "Neighborhood of Discovery," add a friendly touch. And the striking double helix of a DNA molecule repeats everywhere: twisted into the nylon banners, bent into the metal signs.

Designer Virginia Gehshan reports that the project included scores of consultations with the University of Maryland Medical Systems as well as presentations before two sign commissions and a city manager. Consultants included an engineer and landscape architects. The program's second phase was installed in 1993.

Bright colors and a twisted "double helix" motif provide a high-tech but friendly identity for a formerly faceless urban neighborhood comprised mostly of medical and graduate school facilities.

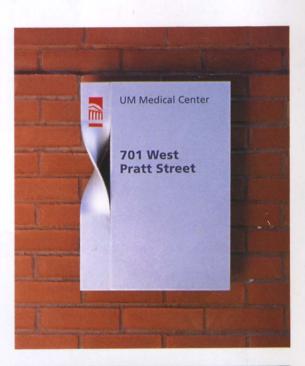

A unified system of freestanding directional signs, traffic signs and banners helps make this area more accessible to the public. Signs at the far left conform to Baltimore's city-wide directional sign program, one of the first such systems in the United States. Several of the sign types will be built and installed in future phases.

University of Maryland buildings are marked with two-piece aluminum signs. Straight sheets of aluminum hold the building name and address while a narrow aluminum strip, twisted into the familiar double helix, holds the University's logo. Small wall-mounted signs repeat the shape and construction.

Vehicular directional signs are simple aluminum blades painted the project red and purple. Red indicates parking.

Cloud and Gehshan devised two sets of banners for the neighborhood. The first set of 40, which attach to light poles, pair traditional banners with twisted ribbons repeating the double helix shape. The second set, installed along a 4-lane boulevard in 1993, can be read at a greater distance. Instead of the twisted ribbon, a graphic representation of the double helix accompanies the area's new motto: "Neighborhood of Discovery."

The new identity has been so popular that the designers have been called on to apply it to even more uses, such as this construction barricade and a stylish trophy for a new annual award commemorating achievement in the life sciences.
